

Project 1: Student Management System

The **Student Management System** is a digital platform designed to simplify the management of student records in educational institutions. The system allows administrators to store, update, and retrieve student information such as personal details, academic performance, and attendance records efficiently. By automating these processes, the system reduces manual paperwork and minimizes errors, ensuring accurate and up-to-date records.

The system is developed using **Python with Django** for the backend and **React.js** for the frontend, providing a responsive and user-friendly interface. Data is stored securely in a **MySQL database**, ensuring reliability and quick access. Key features include student registration, grade tracking, and report generation, which help educators and administrators make informed decisions.

The goal of this project is to enhance administrative efficiency, improve data accuracy, and provide a centralized platform for managing student information. By implementing this system, schools and universities can save time, reduce redundancy, and improve overall student record management.
